                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              variety. Cloning sites: EcoRI (5'-end of cDNA) and XhoI (3'-end of cDNA). NOTE: Due to a cloning artefact caused by the kit, in most cases the EcoRI site is NOT present, as well as the EcoRI adapter. Average insert size is 1 kb Sequence trimming: Vector sequences and sequence ends were trimmed from the 5'-and 3'-end until a 50 bp window.

                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   exon
The sequence is that of the waxy gene which codes for glucosyl transferase. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, e.g. hormones, growth factors, antibodies, enzymes, dyes,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating the payload protein in starch, it is more resistant to degradation by stomach acids.

It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, e.g. hormones, growth factors, antibodies, enzymes, dyes, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating the payload protein in starch, it is more resistant to degradation by stomach acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen-synthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene, involved in production of amylopectin or amylose in its original host. The method is used to produce plant-like starches by fermentation and new starches in plants. These starches are useful for all food and non-food applications of starch. The present sequence is used in
                                                                                                                                                                                                                              3260
                                                                                                                                                                                                                                                                                                                                                        3140
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1915 BP; 365 A; 610 C; 641 G; 299 T; 0 other;

                                                                                                                                                                                                                                                                                                                                               3196
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize belta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, hearth and the processes in a pose of the pear, petunia, pear, pea

                                                                                                                                                                             cell line into which an apoptosis resistance gene has been introduced.

CC associated genes. These can then be used in a variety of diseases for cwhich the induction of apoptosis by gene transfer, or where the cc inhibition of harmful apoptosis, is therapeutic. The recombinant viruses can then be used in a variety of diseases for cc which the induction of apoptosis by gene transfer, or where the cc inhibition of harmful apoptosis, is therapeutic. The recombinant viruses care useful as vectors for gene therapy which can be applied to cancer cc therapy for destroying cancer cells selectively, the treatment of cc autoimmune diseases and graff rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of the cells producing the virus will be destroyed because the period of cc time required to induce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated cc gene. In this invention an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the plasmid pRx-ires-bsr, which contains the cowpox virus bsr gene, and cc is used in an example from the present invention.

C The recombinant viruses generated are capable of expressing apoptosis. CC associated genes. These can then be used in a variety of diseases for CC which the induction of apoptosis by gene transfer, or where the CC inhibition of harmful apoptosis, is therapeutic. The recombinant viruses CC are useful as vectors for gene therapy which can be applied to cancer CC therapy for destroying cancer cells selectively, the treatment of CC autoimmune diseases and graft rejection reaction, and apoptosis induction CC therapy for inflammatory cells in inflammatory diseases. Prior arts have CC encountered the problem where if an ademovirus vector capable of CC the required to induce cell death by apoptosis is shorter than that CC expressing an apoptosis-associated gene is introduced into animal cells, CC the cells producing the virus will be destroyed because the period of CC the required to induce cell death by apoptosis is shorter than that CC cobtain a recombinant virus having the integrated apoptosis-associated GC gene. In this invention an apoptosis-resistant 293 cell line (having an CC apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the CC plasmid pRx-Bcl-xl-bsr, which contains the human Bcl-xl gene, and colored is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                             4893

CC The present invention describes an apoptosis-resistant virus-sensitive CC cell line into which an apoptosis resistance gene has been introduced. CT The recombinant viruses generated are capable of expressing apoptosis-CC associated genes. These can then be used in a variety of diseases for CC which the induction of apoptosis by gene transfer, or where the CC inhibition of harmful apoptosis, is therapeutic. The recombinant viruses CC are useful as vectors for gene therapy which can be applied to cancer CC therapy for destroying cancer cells selectively, the treatment of CC autoimmune diseases and graft rejection reaction, and apoptosis induction CC therapy for inflammatory cells in inflammatory diseases. Prior arts have CC encountered the problem where if an adenovirus vector capable of CC expressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of CC time required to induce cell death by apoptosis is shorter than that CC contain a recombinant virus having the integrated apoptosis-associated CC gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the CC problem. The present sequence represents the cowpox virus bar gene which CC is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          γQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Qγ

cell line into which an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis associated genes. These can then be used in a variety of diseases for which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of
                                     expressing an approtosis associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the plasmid pRx-Bcl 2-i-hcD 25, which contains the human Bcl-2 gene, and is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 3; Page 46-49; 51pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancers and tumours. The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the 33 genomic sequences derived from tumour suppressor genes and

The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of the diagnosis and d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 9539 BP; 2078 A; 121 C; 2281 G; 5059 T; 0 other;
